Primary structure of alpha-subunit precursor of Torpedo californica
acetylcholine receptor deduced from cDNA sequence
Nature 299 (5886), 793-797 (1982)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The alpha subunit for the acetylcholine receptor consists of 461 amino acids including a 24 amino acid prepetide. This subunit is thought to contain the acetylcholine binding site and [1] suggests possible sites. Although the sequences ([1] versus [2], [4]) differ at > twenty sites, this probably reflects species variation, since all propose the same protein sequence with exception of the amino acid residue 42 (site 383). [2] argues that the single mRNA species for achr-alpha falls to cross-hybridize with the same mRNA from cat muscle. [4] proposes a model for the transmembrane organization of the alpha-subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                    Numa, 5., Noda, M., Takahashi, H., Tanabe, T., Toyosato, M., Furutani, Y. and Kikyotani, S.

Patent No. 6100046

GENERAL INFORMATION:

APPLICANT: ELGOTHEN, ANA BELEN

APPLICANT: BOULTER, JAMES R.

APPLICANT: HEINEMANN, STEPHEN F.

TITLE OF INVENTION: CLONING AND EXPRESSION OF A NOVEL

TITLE OF INVENTION: ACETYLCHOLINE-GAIED ION CHANNEL RECEPTOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                       N. The present invention describes a method for preventing or inhibiting an indication or disease associated with aberrant, pathogenic or undesirable antibody production, particularly autoimmune or allergic diseases. The method comprises administering a T cell epitope peptide. The sequence of the epitope peptide comprises an immunodominant T cell epitope sequence of the immunodominant T cell epitope sequence. The method can be used to specifically tolerise or down requisite the priming or activity of antigen specific T cells of a mammal. It can be used to prevent or inhibit an indication or disease associated with antibody production to an antigen such as an endogenous antigen, e.g. acetylcholine receptor, insulin, growth hormone, factor VIII or factor IX, or an exogenous antigen e.g. a fungal antigen, a plant antigen, an antigen of a dumestic cat or an antigen of a mit. It can be used to treat autoimmune diseases, e.g. myasthenia gravis, systemic lupus erythematosus (SLE), Grave's disease, autoimmune haemolytic anaemia, thrombocytopenic purpura, caucoimmune asthma, cryoglobulinaemia, thrombic thrombocytopenic purpura, cused for treating allergic diseases, e.g. allergic sathma, atopic dermatitis, allergic gastreontheropathy, anaphylaxis, cuticaria or angloedema. It can allergic some therapy for treating cathma, atopic dermatitis, allergic gastreontheropathy, anaphylaxis, adamontate and an animication such as hamonphila or diabetes or an indication such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               adenosine deamidase deficiency, growth hormone deficiency, insulin deficiency, factor IX deficiency or factor VIII deficiency. The present sequence encodes human acetylcholine receptor which is used in the exemplification of the present invention.
                                                                                                                                                      preventing allergies

With a suitable carrier in pharmaceutical compositions, and is useful for such therapeutic (especially masal or oral) administration and diagnosis. MG is a human neuromuscular disorder, in which automatibodies against AChR bind to the receptor and interfere with signal transmission from nerve to muscle at the neuromuscular junction. The extracellular chomain of the AChR alpha-subunit appears to be the prime target for these autoantibodies, particularly the main immunogenic region (MIR). The protein enables antiger specific immunotherapy which suppresses only adverse autoimmune responses whilst leaving overall immune system

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes a human acetylcholine receptor (hachR) alpha subunit variant which is used as all or part of a protein for another subunit variant which is used as all or part of a protein for modulating the autoimmune response of an individual to hAChR. The protein can be administered to alleviate and/or treat myasthenia gravis (MG), and is useful for diagnosing the condition. It can be combined with herapeutic (especially masal or oral) administration and is useful for such therapeutic (especially masal or oral) administration and diagnosis. MG is a human neuromuscular disorder, in which autoantibodies against AChR blud to the receptor and interfere with signal transmission from nerve to muscle at the neuromuscular junction. The extracellular domain of the AChR alpha-subunit appears to be the prime target for these autoantibodies, particularly the main immunogenic region (MTR). The protein enables antigen-specific immunotherapy which suppresses only adverse autoimmune responses whilst leaving overall immune system in a protein enables antigen-specific immunosuppressive intered.

The present sequence encodes a human acetylcholine receptor (hAchR)
alpha-subunit variant which is used as all or part of a protein for
modulating the autoimmune response of an individual to hAchR. The
modulating the autoimmune response of an individual to hAchR. The
protein can be administered to alleviate and/or treat mysathenia gravis
(MG), and is useful for diagnosing the condition. It can be combined
if the suitable carrier in pharmaceutical compositions, and is useful
for such therapeutic (especially nasal or oral) administration and
diagnosis. MG is a human neuromuscular disorder, in which autoantibodies
diagnosis. MG is a human neuromuscular disorder, in which autoantibodies
against AchR alpha-subunit appears to be the prime target for
commain of the AchR alpha-subunit appears to be the prime target for
these autoantibodies, particularly the main immunogenic region (MIR).
The protein enables antigen-specific immunotherapy which suppresses only
adverse autoimmune responses whilst leaving overall immune system
intact, unlike current methods of treating MG using immunosuppressive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                   drugs e.g. steroids. AChR is an autoantigen involved in the pathogenesis of myasthenia gravis. AChR peptide segments are used in the construction of MHC class II-peptide conjugates utilised in the treatment of autoimmune diseases, or as vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence shows the mRNA for the alpha subunit of acetylcholine receptor protein. This sequence may be used in the construction of an MHC-peptide complex which comprises an antigenic peptide, eg. ACHR peptide 195-215 or myelin basic protein peptide MBP(1-14)A4, and an isolated MHC subunit component which has an antigen binding site, where the antigenic peptide is associated with the antigen binding site. The MHC-peptide complex selectively binds a T-cell receptor on T-cells associated with diseases, esp. autoimmune diseases. This subunit derived from the MHC antigen. The incorporated in the asequence encoding the subunit derived from the MHC antigen. The incorporated site will be such that, when the subunit is expressed and folded, the ACHR peptide antigen will be available as an epitope for the target T-cells. The complex may be used to identify and inhibit aspects of the immune

The ACHR peptide 195-215, which has been characterised as an epitope in myasthenia gravis (MG) in humans and in mice, may be connected to the N-terminal antigen binding site of a polypeptide derived from an MHC antigen associated with MG. For example, if the recombinant complex is to be used in mice, the AChR peptide may be incorporated into a sequence encoding either the I-Ab-alpha or I-Ab-beta chain (see AAQ13504-55 respectively). If the AChR peptide is to be incorporated into the beta chain, for example, the oligonucleotide may be inserted as a replacement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     216

They have been conjugated with MHC class II components such as I-Ab-apha chain (encoded by sequence AAQ56919) or I-Ab-beta chain (encoded by AAQ56920) and a toxin or label to form conjugates used to target helper I-cells for the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 TCCGAACATGAGACCCGTCTGGTGGCAAAGCTATTTAAAGACTACAGCAGCGTGGTGCGG

```
The present sequence encodes a human acetylcholine receptor (hAChR)

alpha-subunit variant which is used as all or part of a protein for

modulating the autoimmune response of an individual to hAChR. The

protein can be administered to alleviate and/or treat myasthenia gravis

(MG), and is useful for diagnosing the condition. It can be combined

vith a suitable carrier in pharmaceutical compositions, and is useful

for such therapeutic (especially masal or oral) administration and

diagnosis. MG is a human neuromuscular disorder, in which autoantibodies

against AChR bind to the receptor and interfere with signal transmission

from nerve to muscle at the neuromuscular junction. The extracellular

domain of the AChR alpha-subunit appears to be the prime target for

these autoantibodies, particularly the main immunogenic region (MIR).

The protein enables antigen-specific immunotherapy which suppresses only

adverse autoimmune responses whilst leaving overall immune system

contact, unlike current methods of treating MG using immunosuppressive
                                                                                                                                                                                                                                                                                                                                                                                     drugs e.g. steroids.
N.B. The present sequence is not given in the specification but has been created by the indexer as specified in the claim usin the sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes a human acetylcholine receptor (hAchR) alpha subunit variant which is used as all or part of a protein for modulating the autoimmune response of an individual to hAchR. The protein can be administered to alleviate and/or treat myasthenia gravis (MG), and is useful for diagnosing the condition. It can be combined with a suitable carrier in pharmaceutical compositions, and is useful for such therapeutic (especially masal or oral) administration and diagnosis. MG is a human neuromuscular disorder, in which autoantibodies against AChR bind to the receptor and interfere with signal transmission from merve to muscle at the neuromuscular junction. The extracellular choman interfere which signal transmission from merve to muscle at the neuromuscular junction. The extracellular choman contraction and interfere with signal transmission choman of the AChR alpha esubunit appears to be the prime target for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      drugs e.g. steroids. The cells expressing the alpha and/or beta MachR subunits may be used in a method of screening compounds to identify any which modulate the activity of human neuronal NaChR. Subunit specific antibodies may be used to monitor the distribution and expression density of various subunits in normal vs diseased brain tissues. Testing of single receptor subunits or specific receptor subunits combinations with a variety of potential agonists or antagonists provides information with respect to the function and activity of the individual subunits and should lead to the identification and design of compounds that are capable of very specific interaction with one or more receptor subtypes. The resulting drugs should exhibit fewer unwanted side effects than drugs identified e.g. screening with cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human neuronal nicotinic acetylcholine receptor alpha-2 subunit cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           928
                                                                                                                                          DNA encoding the human nNAChR alpha2 subunit was isolated froma human thalamus tissue CDNA library using corresp. rat cDNA. The insert of one clone obtd. was ligated with the insert of another clone to generate a full-length alpha 2 subunit cDNA. The DNA can be used to identify function nNAChRs. Cells contg. the DNA can be used for screening to identify cpds. which modulate the activity of human nNAChRs. The human nNAChR alpha 2 subunit can be used to product antibodies which can be used in immunohistochemistry, diagnosis and therapy. The nucleic acids can be used for analysing disease states
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          62 CAGTGGAAGACCACCCCCAGGTCGTGGAGGTCACCGTGGGCCTGCAGCTGATACAGCTCA 121
